

CITS3005 Project Marking Sheet

This table is adapted from last year's PDF rubric and reformatted for this year's use.

Criterion	Weight	Excellent	Good	Satisfactory	Inadequate
Knowledge Graph	8	Clear, well-thought-out schema with no redundancy, supporting the full range of queries and constraints. Valid format with complete coverage of the domain.	Clear schema with no redundancies, supporting most queries and constraints. Valid format with near-complete coverage of the target dataset.	Mostly clear schema, supporting some queries and constraints. Valid RDF format with sufficient coverage of the target dataset.	Non-functional or inconsistent schema. Data not stored in valid RDF format, or coverage is low.
KG Queries	7	Well-formatted and correct SPARQL queries demonstrating the requested functions and the full expressive capability of the knowledge graph.	Well-formatted and correct SPARQL queries demonstrating the requested functions and some expressive capability of the knowledge graph.	Mostly correct SPARQL queries demonstrating the requested functions with clear instruction.	Incorrect queries, or unable to execute in the provided knowledge graph.
Ontology	6	Well-chosen classes and properties with clear logic, reflecting the true nature of the domain.	Well-chosen classes and properties reflecting the general nature of the domain.	Mostly sufficient classes and properties reflecting the general nature of the domain.	Lacks critical classes and properties required to adequately model the application domain.
Constraints	6	Accurate constraints and axioms, showing careful consideration of the application domain.	Accurate constraints and axioms with consideration of the application domain.	Some constraints and axioms capture the application domain.	Constraints are missing, inaccurate, or do not meaningfully represent the application domain.

Criterion	Weight	Excellent	Good	Satisfactory	Inadequate
Reasoning	6	Considered use of RDFS, OWL and SWRL to appropriately capture domain constraints, with demonstrated non-trivial reasoning capability.	Considered use of RDFS, OWL and SWRL to appropriately capture domain constraints, with demonstrated reasoning capability.	Use of RDFS, OWL and/or SWRL to adequately capture domain constraints, with some demonstration of reasoning.	Unable to demonstrate any non-trivial reasoning.
Application	6	Intuitive, well-designed application allowing users to effectively navigate the knowledge graph.	Complete application allowing users to navigate the knowledge graph.	Basic functionality as scripts running on top of OWLReady2 ontology, allowing users to access the knowledge graph.	Programmatic interface only, with significant errors or design flaws preventing users from accessing the knowledge graph.
User Manual	15	Comprehensive overview of schema, axioms and queries. Complete instructions sufficient for running the application, building queries and executing test data.	Overview of schema, axioms and queries. Sufficient instructions for running the application, building queries and executing test data.	Mostly complete overview of schema, axioms and queries. Some instructions for running the application and building queries.	Incomplete or incomprehensible schema description, missing explanations, or lacking alignment to submitted code.
Report	6	Clear, persuasive rationale for design choices and insightful description of tools, processes and resources used.	Clear rationale for design choices and a good description of tools, processes and resources used.	Some rationale for design choices and some description of tools, processes and resources used.	Lacking rationale and/or inadequate description of processes used.
Overall	60
